PEDIATRIC REHABILITATION

OUR COMMITMENT

Exeter Hospital's Pediatric Rehabilitation Program is committed to offering the highest quality care to anyone under the age of 21 in need of our services. Our goal is to provide excellent care by offering technically superior services in a compassionate environment. We do this by engaging families in the treatment process and responding to your specific needs and preferences.

Exeter Hospital's Pediatric Rehabilitation Program offers physical, occupational, and speech therapy to treat a wide range of neurodevelopmental and orthopaedic diagnoses for those under the age of 21 at any level of functioning. Our clinicians collaborate with pediatricians, family practitioners, physician specialists and school providers, and work closely with parents and other family members to ensure individualized treatment plans for each client/patient.

OUR PHYSICAL THERAPISTS specialize in evaluation and treatment of children requiring help with balance and coordination, gross motor skills, neuromusculoskeletal function, postural control/core strength, gait training and more.

OUR OCCUPATIONAL THERAPISTS have extensive training in evaluation and treatment of sensory processing, neuromusculoskeletal conditions, fine motor coordination, handwriting, activities of daily living and visual perceptual skills.

OUR SPEECH THERAPISTS are skilled in providing evaluation and treatment of articulation disorders, receptive and expressive language delays, social/pragmatic skills, oral motor skills, feeding and swallowing and more.

We also offer specialty services including post-surgical rehabilitation, equipment management, myofascial release, orthopaedic taping, neurodevelopmental treatment (NDT), craniosacral therapy, Handwriting Without Tears®, Therapeutic Listening®, Lite Gait® and Modified Barium Swallow Test.
