

LiteGait®

The Original Partial Weight Bearing
Gait Therapy Device

Rehabilitation services at Exeter Hospital is pleased to offer the LiteGait® system to the treatment options available to address gait related issues in children.

LiteGait® is a system that helps to improve posture, balance and locomotion. Appropriate for use with a wide range of medical conditions and physical challenges. LiteGait® eliminates the risk and fear of falling. The unique harness design allows the child to be in an upright position providing the support necessary to practice standing and walking, gradually increasing his/her weight bearing load. It also allows the therapist to observe gait patterns and to make manual corrections.

As a gait therapy device which promotes the generation of normal walking patterns, LiteGait® represents a major advancement in clinical gait therapy.

To schedule an appointment for a child, please call (603) 777-1885

A physician referral is required.

The LiteGait® system is located at the Epping site
